

Solving One-Step Equations

 Guided Notes

A **One-Step Equation** is an equation that can be solved in one-step using the properties of equality.

If x is the variable in the equation, then the one-step equation can be of the forms:

$$x + a = b$$

$$x - a = b$$

$$ax = b$$

$$\frac{x}{a} = b$$

Properties of Equality

To solve one-step equations, the following properties of equality are used.

- **Addition Property of Equality**
- **Subtraction Property of Equality**
- **Multiplication Property of Equality**
- **Division Property of Equality**

These properties are applied on both sides of the equality.

Using Addition Property of Equality

This property means adding same number on both sides of the equation and is applicable on the following type of equations:

$$x - a = b$$

Problem 1: Solve $x - 12 = 4$.

Solving One-Step Equations

 Guided Notes

Using Subtraction Property of Equality

This property means subtracting same number on both sides of the equation and is applicable on the following type of equations:

$$x + a = b$$

Problem 2: Solve $z + 4 = 9$.

Using Multiplication Property of Equality

This property means multiplying same number on both sides of the equation and is applicable on the following type of equations:

$$\frac{x}{a} = b$$

Problem 3: Solve $\frac{y}{24} = 2$.

Name: _____ Period: _____ Date: _____

Solving One-Step Equations

Guided Notes

Using Division Property of Equality

This property means dividing same number on both sides of the equation and is applicable on the following type of equations:

$$ax = b$$

Problem 4: Solve $3x = 24$.
