## Patterns, Equations, and Graphs Guide Notes

SOLUTION OF AN EQUATION containing two variables, $\boldsymbol{x}$ and $\boldsymbol{y}$, is any ordered pair $(\boldsymbol{x}, \boldsymbol{y})$ that makes the equation true.
ORDERED PAIR - is a set of numbers or coordinates written in the form $(\boldsymbol{x}, \boldsymbol{y})$. It can be used to show the position on a graph, where the $\boldsymbol{x}$ (horizontal) value is first, and the $\boldsymbol{y}$ (vertical) value is second.

Sample Problem 1: Tell whether the given order pair is a solution of each equation.
A. Is $(\mathbf{3 0}, \mathbf{3})$ a solution of the equation $\boldsymbol{x}-\mathbf{1 4}=\mathbf{5 y}$ ?

$$
\begin{gathered}
30-14=5(3) \\
30-14=15 \\
16 \neq 16
\end{gathered}
$$

B. Is $(\mathbf{1 2}, 5)$ a solution of the equation $\mathbf{4 x}+\mathbf{2}=\mathbf{1 0 y}$ ?

$$
\begin{gathered}
4(12)+2=10(5) \\
48+2=50 \\
50=50
\end{gathered}
$$

C. Is $(7,1)$ a solution of the equation $\mathbf{8 x}-\mathbf{6}=\mathbf{5 0 y}$ ?

$$
\begin{gathered}
8(7)-6=50(1) \\
56-6=50 \\
50=50
\end{gathered}
$$

There are various ways to show the relationship between two variables:
A. Create a TABLE to show the corresponding values of $x$ and $y$,

Example: John is three years younger than his brother Matthew. Construct a table that represents their age.

| John | Matthew |
| :---: | :---: |
| 1 | 4 |
| 2 | 5 |
| 3 | 6 |
| 4 | 7 |

B. Write an EQUATION, or.

Example: John is three years younger than his brother Matthew. Write an equation that represents their age.

Let : $\boldsymbol{J}=$ John's age $\quad \boldsymbol{M}=$ Matthew's age

$$
J+3=M
$$

C. Draw a GRAPH.

COORDINATE SYSTEM is a two-dimensional number line. This is a typical coordinate system: The horizontal axis is called the $\boldsymbol{x}$-axis and the vertical axis is called the $\boldsymbol{y}$-axis

$$
y \text {-axis }
$$

Example: John is three years younger than his brother Matthew. Draw a graph that represents their age.

Sample Problem 2: Use a table, an equation, and a graph to represent the relationship of Mary's and Ann's age.

Mary is $\mathbf{2}$ years older than Ann.

| Mary | Ann |
| :---: | :---: |
| 1 | 3 |
| 2 | 4 |
| 3 | 5 |
| 4 | 6 |

Let :

## $J=J o h n ' s$ age

M=Mary's age

$$
A+2=M
$$

INDUCTIVE REASONING is the process of reaching a conclusion based on an observed pattern. It is used to predict values.

Example 4: Predict the next figure in the given sequence.

Sample Problem 3: Predict the next figure in the each sequence.
