Patterns and Linear Functions

Unit 4 Lesson 2

PATTERNS AND LINEAR FUNCTIONS

Students will be able to:

Represent a relationship using a table, graph, words, ordered pairs and functions

Key Vocabulary:

- Patterns
- Table, Graph, Words
- Ordered pair
- Linear Function

Patterns and their Representations

In mathematics, anything arranged following a certain rule or a set of rules represent a pattern. The relation represented in a pattern can be represented in the following ways:

- **Table**
- **Graph**
- **Ordered Pairs**
- **Words**
- **Equation**

PATTERNS AND LINEAR FUNCTIONS

Representation using table:

A table is made using the data in the patterns. There is an input and corresponding output associated with each input.

Representation using graph:

A graph can be made using the input and output values from the patterns.

Representation using ordered pairs:

The relationship between the data can also be represented using ordered pairs (x,y) where x represents input and y represents output.

Representation using words:

A relationship in a pattern can also be represented using words by using words for the mathematical operations like “**times**” for multiplication.

Representation using an equation:

An equation can be used to represent the relation between variables using the equation notation like “ $y = ax + b$ ”.

PATTERNS AND LINEAR FUNCTIONS

Problem 1: For each diagram given below, find the relation between the number of shapes and the perimeter of the figure they form. Represent this relationship using a table, words, an equation and a graph.

1 square

2 squares

3 squares

PATTERNS AND LINEAR FUNCTIONS

Problem 1: For each diagram given below, find the relation between the number of shapes and the perimeter of the figure they form. Represent this relationship using a table, words, an equation and a graph.

Using Table:

Number of Squares	1	2	3
Perimeter	4	6	8

Using Words:

The pattern shows that the perimeter is two more than twice the number of squares.

PATTERNS AND LINEAR FUNCTIONS

Problem 1: For each diagram given below, find the relation between the number of shapes and the perimeter of the figure they form. Represent this relationship using a table, words, an equation and a graph.

Using Equation: $Perimeter = 2(\text{number of squares}) + 2$

Using Graph:

PATTERNS AND LINEAR FUNCTIONS

Function

A function is a relation in which each input is related to one and only one output.

Linear Function

A function is a linear function whose graph makes a line.

PATTERNS AND LINEAR FUNCTIONS

Problem 2: Identify whether the data shown in the table represents a function or not. If yes, is the function linear?

Day	Tickets Sold
1	70
2	60
3	50
4	40

PATTERNS AND LINEAR FUNCTIONS

Problem 2: Identify whether the data shown in the table represents a function or not. If yes, is the function linear?

For each value of input (Day), we have one and only one value of output (Ticket). So **it is a function.**

The graph of the function is a straight line, so it is a **linear function.**

Day	Tickets Sold
1	70
2	60
3	50
4	40
